

Coding Architecture:

SAP provide the 2 DLL for Presentation(SAPBOUICOM) and Database Access(SAPBOBSCOM).

and we have use the three level or Layer Architecture in .net as below.

Layer indicates logical separation of components, such as having distinct namespaces and classes for the Database Access Layer, Business Logic Layer and User Interface Layer.

2. Three Tier/Layer Architecture Design Components

As we have already seen, tier is the sum of all the physical components. We can separate the three tiers as Data Tier, Business Tier and Presentation Tier.

- Data Tier is basically the server which stores all the application's data. Data tier contents Database Tables, XML Files and other means of storing Application Data. In SAP we have use the SAPBOBSCOM DLL to store the data in database table.
- Business Tier is mainly working as the bridge between Data Tier and Presentation Tier. All the Data passes through the Business Tier before passing to the presentation Tier. Business Tier is the sum of Business Logic Layer, Data Access Layer and Value Object and other components used to add business logic. In SAP We have use the logic to connect the SAP Presentation layer to SAP database.
- Presentation Tier is the tier in which the users interact with an application. Presentation Tier contents Shared UI code, Code Behind and Designers used to represent information to user. In SAP we have use the SAPBOUICOM DLL to

present the data in UI form. We have used the Screen Painter forms for the presentation.
